This volume provides a practical overview of the ethical issues arising in pediatric practice. The case-based approach grounds the bioethical concepts in real-life situations, covering a broad range of important and controversial topics, including informed consent, confidentiality, truthfulness and fidelity, ethical issues relating to perinatology and neonatology, end-of-life issues, new technologies, and problems of justice and public health in pediatrics. A dedicated section also addresses the topics of professionalism, including boundary issues, conflicts of interests and relationships with industry, ethical issues arising during training, and dealing with the impaired or unethical colleague. Each chapter contains a summary of the key issues covered and recommendations for approaching similar situations in other contexts. Clinical Ethics in Pediatrics: A Case-Based Textbook is an essential resource for all physicians who care for children, as well as medical educators, residents and scholars in clinical bioethics.

This volume offers a theoretical and practical overview of the ethics of pediatric medicine. It serves as a fundamental handbook and resource for pediatricians, nurses, residents in training, graduate students, and practitioners of ethics and healthcare policy. Written by a team of leading experts, Pediatric Bioethics addresses those difficult ethical questions concerning the clinical and academic practice of pediatrics, including an approach to recognizing boundaries when confronted with issues such as end of life care, life-sustaining treatment, extreme prematurity, pharmacotherapy, and research. Thorny topics such as what constitutes best interests, personhood, or distributive justice and public health concerns such as immunization and newborn genetic screening are also addressed.

This book examines the many ethical issues related to health and health care in children. It describes the field of Pediatric ethics, a unique and important aspect of the discipline of bioethics, the study of moral conduct in health care and the rational process for determining the best course of action in the face of conflicting choices. The book begins with an exploration of what it means to be a child in America and the unique kinship relationships and obligations engendered by the decision of parents to have a child, and it examines ethical principles and professional obligations related to the care of children. Each of the chapters in the book focuses on important ethical concerns. It begins with ethical issues in creating babies using reproductive technologies, and then continues with an analysis of the ethical issues in labor and delivery of a child. The book continues with an in depth analysis of the many hard choices faced by families and clinicians in the care of critically ill neonates, and then goes on to describe current controversies in caring for older children who are dying and their families, as well as ethical issues concerning adolescents, research ethics as it relates to children, issues concerning genetic testing, screening and biobanking, and surgical and medical enhancement of children. Each chapter has case examples to illustrate the real life concerns of patients, families and clinicians. The book is intended for students in pediatrics and ethics, as well as for practicing clinicians, and interested families.

Children in precarious health present particular problems for healthcare professionals because of their intimate relation to their family, and because of the family's need to provide major long-term source of support and to be actively involved in the decisions about their children's care. This collection of cases and commentaries in pediatrics highlights the difficult ethical dilemmas that can arise during high-tech hospital care of children in precarious circumstances. It serves as a teaching tool for clinical ethics and as an introduction for medical students and residents. Clinical cases are described in detail by the physicians involved, who focus on the ethical issues arising during treatment. Each case is then commented on in detail by a philosopher or other bioethicist. It thus serves well as an introduction to contemporary clinical bioethics, but with a firm grounding in the practicalities of real-life pediatric care in the hospital setting.

Clinical ethicists encounter the most emotionally eviscerating medical cases possible. They struggle to facilitate resolutions founded on good reasoning embedded in compassionate care. This book fills the considerable gap between current texts and the continuing educational needs of those actually facing complex ethics consultations in hospital settings. 28 richly detailed cases explore the ethical reasoning, professional issues, and the emotional aspects of these impossibly difficult consultations. The cases are grouped together by theme to aid teaching, discussion and professional growth. The cases inform any reader who has a keen interest in the choices made in real-life medical dilemmas as well as the emotional cost to those who work to improve the situations. On a more advanced level, this book should be read by ethics committee members who participate in ethics consultations, individual ethics consultants, clinicians who seek education about complex clinical ethics cases, and bioethics students.

In recent decades, advances in biomedical research have helped save or lengthen the lives of children around the world. With improved therapies, child and adolescent mortality rates have decreased significantly in the last half century. Despite these advances, pediatricians and others argue that children have not shared equally with adults in biomedical advances. Even though we want children to benefit from the dramatic and accelerating rate of progress in medical care that has been fueled by scientific research, we do not want to place children at risk of being harmed by participating in clinical studies. Ethical Conduct of Clinical Research Involving Children considers the necessities and challenges of this type of research and reviews the ethical and legal standards for conducting it. It also considers problems with the interpretation and application of these standards and conduct, concluding that while children should not be excluded from potentially beneficial clinical studies, some research that is ethically permissible for adults is not acceptable for children, who usually do not have the legal capacity or maturity to make informed decisions about research participation. The book looks at the need for appropriate pediatric expertise at all stages of the design, review, and conduct of a research project to effectively implement policies to protect children. It argues persuasively that a robust system for protecting human research participants in general is a necessary foundation for protecting child research participants in particular.

Pediatric medical ethics are very different from any other clinical setting. This collection presents possible cases and scenarios to help caregivers be better-prepared for complicated ethical questions.

The go-to textbook on the increasingly important and rapidly evolving topic of medical ethics Clinical Ethics is the most popular clinically oriented guide to the complex field of medical ethics. It provides crystal-clear case-based coverage of ethical situations encountered in everyday medical practice. This unparalleled guide is famous for its four-topics method of approaching ethical problems (medical indications, patient preferences, quality of life, and contextual features):an organizational process that helps you better understand the complexities involved in clinical ethics cases and find a resolution for each case. In each chapter, the authors discuss case examples and provide analysis, comments, and specific recommendations. Sections and chapters include: TOPIC 1: Medical Indications Indicated and Nonindicated Interventions Clinical Judgment and Clinical Uncertainty Cardiopulmonary Resuscitation and Orders not to Resuscitate Medical Error Determination of Death TOPIC 2: Preferences of Patients Informed Consent Decisional Capacity Decision Making for the Mentally Incapacitated Patient Surrogate Decision Makers Failure to Cooperate in the Therapeutic Relationship TOPIC 3: Quality of Life Divergent Evaluations of Quality of Life Enhancement Medicine Compromised Quality of Life and Life-Sustaining Interventions Pain Relief for Terminally Ill Patients Medically Assisted Dying Suicide TOPIC 4: Contextual Features Health Professions Other Interested Parties Confidentiality of Medical Information Economics of Clinical Care Allocation of Scarce Health Resources Influence of Religion on Clinical Decisions Role of Law in Clinical Ethics Clinical Research and Education Public Health Organizational Ethics

This book provides the reader with a theoretical and practical understanding of two health care delivery models: the patient/child centred care and family-centred care. Both are fundamental to caring for children in healthcare organizations. The authors address their application in a variety of paediatric healthcare contexts, as well as an understanding of legal and ethical issues they raise. Each model is increasingly pursued as a vehicle for guiding the delivery of health care in the best interests of children. Such models of health care delivery shape health care policies, programs, facility design, resource allocation decisions and day-to-day interactions among patients, families, physicians and other health care professionals. To maximize the health and ethical benefits these models offer, there must be shared understanding of what the models entail, as well as the ethical and legal synergies and tensions they can create. This book is a valuable resource for paediatricians, nurses, trainees, graduate students, practitioners of ethics and health policy.
