When zoning and subdivision ordinances were created in the early 1900s they were two distinct governmental functions. But failure to combine them led to jurisdictions writing contradictory regulations. Author Connor Murphy looks at the standard way subdivision and zoning are presented as separate code titles in most land use regulations then combines the regulations into a single code title -- effectively solving long-standing problems planners have encountered. Common Sense Zoning makes the planning process accessible and transparent for those who wish to create a more livable future. Professional city planners and others can easily understand land use regulations that: • simplify Euclidian zoning • make sense to people who lack expertise in zoning • clearly explain the decision-making process • invite ordinary people to participate in governance • protect communities from scoundrels Common Sense Zoning provides guidance to the 34,000 small governments that can't afford to hire pricey outside consultants or pay millions to update their land use regulations.

Revelation through Science is written for the educated non-scientist who may be troubled by apparent conflicts between science and religion. Are science and faith incompatible? Astronomers, physicists, and biologists have now shown that the more deeply science probes nature, the more it reveals evidence pointing us to God. After reviewing concepts from those fields, Revelation through Science adds new material from chemistry. It describes organic structures that are profoundly vital for life, yet too complex for self-assembly without some guiding principle. It should lift the burden from believers and seekers to realize that science is not the enemy of faith.

The approach used by Hoyle, Schaefer, and Doupnik in the new edition allows students to think critically about accounting, just as they will do while preparing for the CPA exam and in their future careers. With this text, students gain a well-balanced appreciation of the Accounting profession. As Hoyle 12e introduces them to the field's many aspects, it often focuses on past controversies and present resolutions. The text continues to show the development of financial reporting as a product of intense and considered debate that continues today and into the future. The writing style of the eleven previous editions has been highly praised. Students easily comprehend chapter concepts because of the conversational tone used throughout the book. The authors have made every effort to ensure that the writing style remains engaging, lively, and consistent which has made this text the market leading text in the Advanced Accounting market. The 12th edition includes an increased integration of IFRS as well as updated accounting standards.

Illuminating opportunities to develop a more integrated approach to municipal water system design, Natural and Engineered Solutions for Drinking Water Supplies: Lessons from the Northeastern United States and Directions for Global Watershed Management explores critical factors in the decision-making processes for municipal water system delivery. The book offers vital insights to help inform management decisions on drinking water supply issues in other global regions in our increasingly energy- and carbon-constrained world. The study evaluates how six cities in the northeastern United States have made environmental, economic, and social decisions and adopted programs to protect and manage upland forests to produce clean drinking water throughout their long histories. New York, New York; Boston and Worcester, Massachusetts; New Haven and Bridgeport, Connecticut; and Portland, Maine have each managed city watersheds under different state regulations, planning and development incentives, biophysical constraints, social histories, and ownerships. Some of the overarching questions the book addresses relate to how managers should optimize the investments in their drinking water systems. What is the balance between the use of concrete/steel treatment plants (gray infrastructure) and forested/grassland/wetland areas (green infrastructure) to protect surface water quality? The case studies compare how engineered and/or natural systems are employed to protect water quality. The conclusions drawn establish that it makes environmental, economic, and social sense to protect and manage upland forests to produce water as a downstream service. Such stewardship is far more preferable than developing land and using engineering, technology, and artificial filtration as a solution to maintaining clean drinking water. Lessons learned from this insightful study provide effective recommendations for managers and policymakers that reflect the scientific realities of how forests and engineering can be best integrated into effective watershed management programs and under what circumstances.
