Motor Skills Acquisition in the First Year is a descriptive presentation of normal motor development and skill acquisition during the first year of life. It gives a greater understanding of normal motor development and normal movement in infants, in order to treat infants with delayed or aberrant movements. The goal of this book is to inform and enhance knowledge, understanding, and observational skills in the assessment of normal motor development, and to present an analysis of the motor components that babies use to achieve each milestone normally. It provides a background for enlarging the scope of kinesiological analysis and will serve as a stimulus for others to further investigate and analyze the kinesiological aspects of motor development.

Improving FMS can help prevent long term health issues, and increase opportunities for social engagement and independence. There are sections on how to develop and implement a programme for individuals to guide their personal development, and information on planning and tools for assessment are included. Parents of babies and young children are constantly watching and wondering whether their children are reaching their developmental milestones within expected time frames. It is important to keep in mind that each child is unique and that no two children will ever arrive at these milestones simultaneously. Early Childhood Development Checklist aims to guide parents and teachers in the timely identification of developmental delays a child may display. The book covers almost 30 skill categories, such as movement, coordination, communication skills, number concept, writing and perception. Each chapter is divided into age ranges that give comprehensive points to check off. There is also a chapter on age-appropriate stimulation activities to improve a child's ability in any area where a possible developmental delay is identified.
